

Milliken® Conceal® Military Camouflage Technology

Own the Night

As thermal imaging cameras become more portable, and more common, the need increases to hide personnel, especially at night. Working beyond the near infrared range (NIR), into the thermal infrared range, Conceal® camouflage technologies can reduce the risk of detection, so U.S. Armed Forces continue to own the night.

Optimal Thermal Signature Reduction

By significantly reducing the thermal signature of the fabric, Conceal camouflage technology enables the fabric to have a similar surface temperature as the surrounding area. The wearer blends more easily into the background, making them harder to see, and less of a target.

Coming Soon

Tested by the Swiss Army and others, fabrics with Conceal camouflage technology maintain moisture vapor permeability, making them highly protective, yet comfortable. The technology is compatible with other protective characteristics, including climate protection technologies.

Milliken is the exclusive U.S. licensee of this patented SSZ Multispectral Technology. In the coming months, Milliken will be incorporating this technology into Berry Compliant fabrics for the U.S. Military, adding yet another layer of protection to their uniforms.
